

How to troubleshoot Sony ECM-MS907 sound distortion

Sound distortion may exist due to a number of problems involving the wind screen, power cord, jack, or diaphragm.

INTRODUCTION

The following guide will teach you how to examine the wind screen, power cord, jack, and diaphragm.

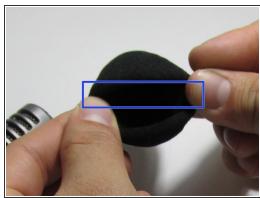

TOOLS:

Phillips #00 Screwdriver (1)

Step 1 — Windscreen Removal and Inspection

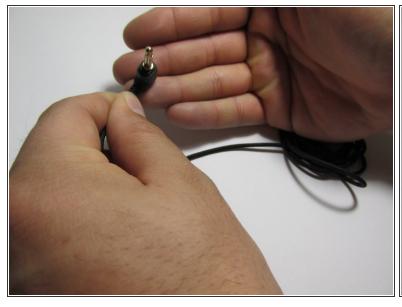

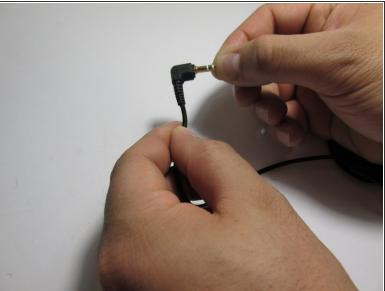

- Remove the windscreen from the top of the microphone.
- Once the foam windscreen is removed, examine the windscreen looking for thinning, holes, tears, or discoloration. Any of these issues may be the cause of the sound distortion.

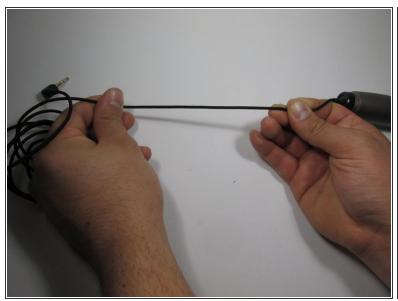

Step 2 — Examine the Jack

 Locate the jack of the microphone and look for: discoloration, rust, breaks in the piece, as well as making sure the jack is not bent or torn from the power cord.

Step 3 — Examining the Cord

 Inspect the cord for splits, breaks, or loose wires. Check the cord from one end to the other, making sure the cord is attached to the microphone.

Step 4

• To check the cord further by unscrewing the bottom piece of the microphone from the top. Rotate clockwise to unscrew the bottom and examine.

Step 5

- Another to assessing distortion is to inspect the diaphragm. For further information, see the <u>Diaphragm Examination Guide</u>
- Use a Phillips head (#00) screwdriver, to remove the diaphragm and separate the diaphragm from the base of the microphone.

Step 6

- Inspect the diaphragm checking to see if the piece is dirty, bent, or has holes. If it is bent or has holes, it may need to be replaced.
- If the diaphragm is dirty, clean it with a dry towel or cotton swab by gently brushing dirt and/or rust off the piece.

To reassemble your device, follow these instructions in reverse order.
